I am a web developer focused on creating experiences for the web, I am capable of building web apps and marketing sites too. I am a self-taught developer so I want to keep learning and improve my skills. In the short term I would like to start making more powerful and performant apps with more complex technologies.

Skills

HTML, CSS, JavaScript	Sass/Scss	Redux
TypeScript	Tailwind/CSS	Currently learning Rust
ReactJs	NextJs	Currently learning WASM

Projects

To-do and notebook

A simple app to manage personal tasks, where the user can store their tasks on lists and those lists on folders.

Right now the app is only a UI demo, I took around 100hr to complete, I hope to keep investing time on improve this app..

My main challenges where and still are to find a way to store and download your data from the browser, because I want this app to run 100% on the web, without any kind of server and anything like that.

Interval timer

This is my own basic work-out timer.

Is 100% useful, I tried to make it as simple as possible, so I created a way to easily create rounds. It lacks an option to repeat rounds and a few sounds, but I am thinking about fix it on the following weeks.

NOTE: I've built more projects, but most of them where 100% intended to be learning projects, so I did't feel like was valuable to show them to the public.

Education

I've made a few courses on programming and design, but I learned most things by reading official documentation and books.

I went to college, but I didn't finish my degree on Economics. Unfortunely I have not formal education relevant to web development.
